## Introduction

A distinguishing feature of the agricultural and food-processing sector is the use of a large amount of advanced-technology and very specific skills. As a consequence, professional people should be trained with suitable instruments, apt to allow ample experimenting on even small-scale productions.

Didacta Italia was the first to introduce a complete line of flexible and modular pilot plants for the experimental teaching of food-processing technologies: they now have the most complete and qualified equipment available on the market.

The units supplied by Didacta have the same features as the machinery used in industry, with the following exceptions:

- they are more flexible (the same machine can be used on different lines);
- they can be used to process small volumes of product;
- they have more complete control instruments;
- they are supplied with handbooks featuring ready-to-use experiments.

This catalogue presents the following line in its standard version:

- **Beer processing line**

to brew deeply fermented beer

In addition to their equipment, Didacta Italia supply a variety of pre-sales and after-sales services (development of special projects, advisory services, installation of equipment at the customer's site, training courses, etc.) for the transfer of know-how often difficult to find on the market.
